

Hospital Medical Report

Patient Name:	John Doe
Age:	45
Gender:	Male
Report Date:	18 May 2026
Medical ID:	MH-2026-00491

Diagnosis:

The patient has been diagnosed with melanoma, a serious form of skin cancer originating from melanocytes.

Clinical Notes:

Irregular pigmented lesion observed on the upper back. Further dermatoscopic evaluation confirms malignant characteristics consistent with melanoma.

Recommended Actions:

Immediate referral to oncology for staging and treatment planning. Suggested options may include surgical excision, immunotherapy, or targeted therapy depending on staging results.
